

What a meme-tastic
time to be alive!

Tori Symons

What is coronavirus?

The disease causes respiratory illness (like the flu) with symptoms such as a cough, fever, and in more severe cases, difficulty breathing. People with COVID-19 generally develop signs and symptoms, including mild respiratory symptoms and fever, on an average of 5-6 days after infection (mean incubation period 5-6 days, range 1-14 days). Most people infected with COVID-19 virus have mild disease and recover.

Government: Stay inside

Half of the US population:

How did this become a pandemic?

In order for something to be considered a pandemic, the virus or disease must spread to other countries. For corona, it has spread to 110 other countries and has killed over 100,000 people worldwide. The virus is easily spread just by touching surfaces that previously was touched by someone with the virus then touching your mouth or eyes. Being coughed or sneezed on can also be a factor to this.

So what are the symptoms and what does it primarily affect?

Symptoms can include coughing, sneezing, fever, flu like symptoms, and difficulty breathing. This virus primarily affects your lungs and respiratory system.

Her: Bet he's thinking about girls

Him: What if COVID-19 cancels Tony vs Khabib

What are the current statistics of this virus?

It has been recently said that there are more than 116,000 deaths worldwide with 1,872,000 confirmed cases. So far around 434,000 of those cases those people survived the virus. Because of this impact, everyone has been put on quarantine which includes staying at home (travel ban), restaurants are closed for the public to dine, schools are closed, and everyone has to social distance and stay 6 feet away from each other.

How it can spread and how to prevent it

Coronavirus can be spread by getting sneezed on, coughed on, touching previous surfaces then touching your mouth or eyes, etc. Ways you can prevent it can include washing your hands, wearing a mask, putting on hand sanitizer, and social distance yourself from friends and non immediate family.

When you're laughing at coronavirus memes and then you cough

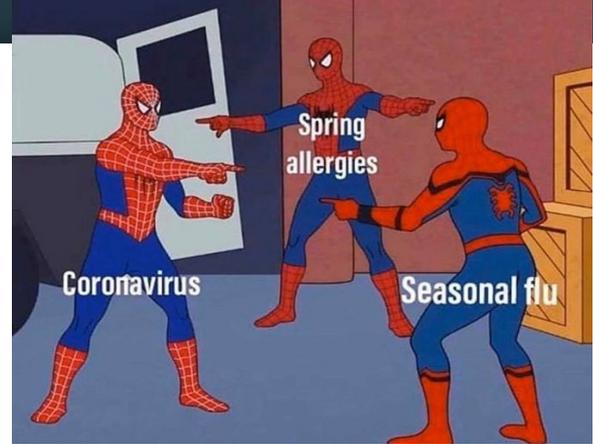

Misconceptions about this virus

1. Spraying/pouring chlorine or alcohol can kill the virus and it's germs. This is false and pouring these things can actually harm you and your skin.
2. Another misconception is only older people and very young kids can get corona. This is also false. Older people and younger kids are more likely to get it but everyone is also at risk no matter what age.
3. The last one is that wearing a mask can prevent you from getting the virus. This is false because you are still at risk for getting it, wearing a mask prevents the individual from spreading it not getting it.

When you're at your favorite Chinese food place and hear a cough from the kitchen

Life during the pandemic

Right now it is very difficult living during this. Everyone is on a travel ban which means you can't drive anywhere unless it is necessary. Everyone must social distance and stay away from everyone by 6 feet; which means no one can hang out with their friends. Also, nonessential places like restaurants (no dine in), arcades, skating, etc are closed until further notice. This is very stressful for me and everyone. Oh and also people are going crazy over toilet paper and getting in fights for it, very strange.

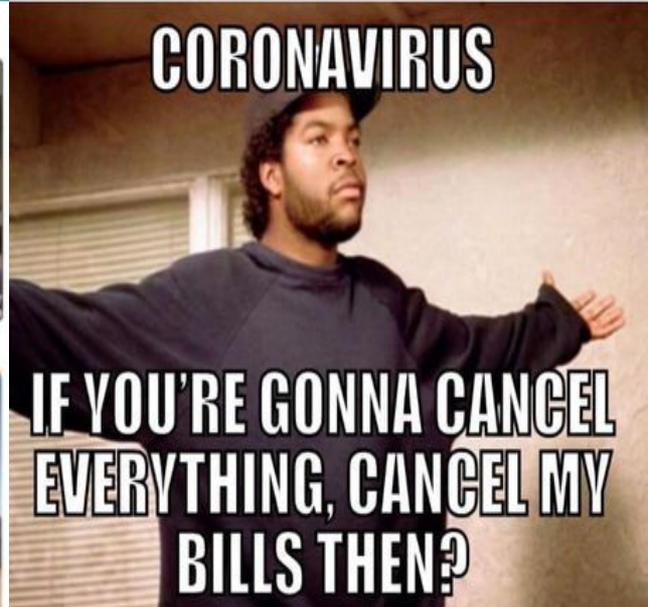

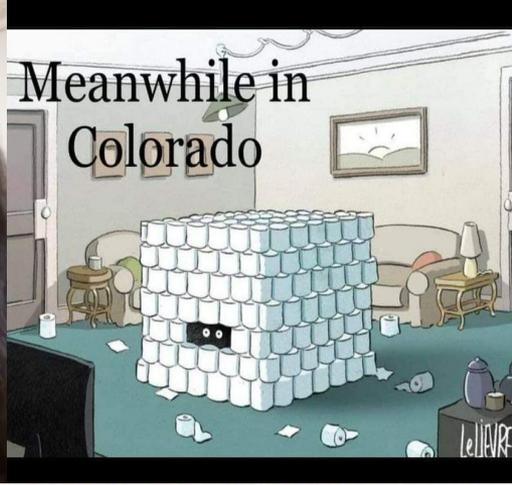

What does the future mean?

No one knows for sure right now so everyone is taking guesses and predictions. Because everything is closed, once things open up again, there will be a small maximum capacity so floods of people don't start coming at once. Stalk markets will start going back to normal after a few months and everything will equal out over months or a year.

Disclaimer for the meme, alcohol cannot kill the virus

**Corona-virus
can be killed by
alcohol**
