

The Meme-ory of COVID-19

By Riley Arvin

What Is The Coronavirus?

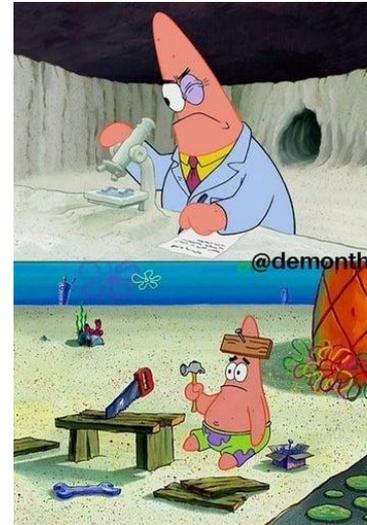

Coronavirus disease is a respiratory illness that can spread from person to person. The virus that causes COVID-19 is a novel coronavirus that was first identified during an investigation into an outbreak in Wuhan, China.

How has the coronavirus become a pandemic?

The World Health Organization on Wednesday declared the rapidly spreading coronavirus outbreak a pandemic, acknowledging what has seemed clear for some time — the virus will likely spread to all countries on the globe. In the United States, where for weeks state and local laboratories could not test for the virus, just over 1,000 cases have been diagnosed and 29 people have died. But authorities here warn continuing limits on testing mean the full scale of spread in this country is not yet known.

Coronavirus and How it works

A virus infects your body by entering healthy cells. There, the invader makes copies of itself and multiplies throughout your body.

The new coronavirus latches its spiky surface proteins to receptors on healthy cells, especially those in your lungs.

Specifically, the viral proteins bust into cells through your body. Once inside, the coronavirus hijacks healthy cells and takes command. Eventually, it kills some of the healthy cells.

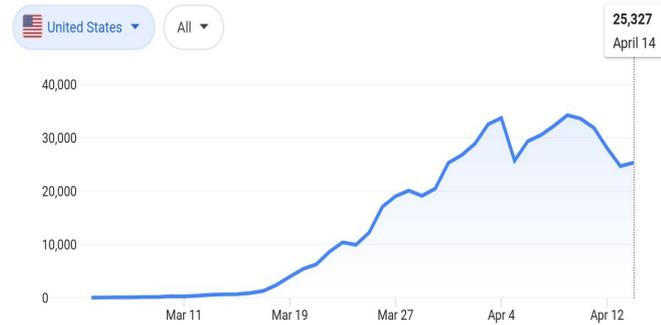

Normal sick people: *stays in bed*

People with Coronavirus:

Spread it across the whole canvas. Nice and even

Statistics and How it'll change the world

Being Anti-Social

Social Distancing

- Decline In Polarization

The extraordinary shock(s) to our system that the coronavirus pandemic is bringing has the potential to break America out of the 50-plus year pattern of escalating political and cultural polarization we have been trapped in, and help us to change course toward greater national solidarity and functionality. It might sound idealistic, but there are two reasons to think it can happen.

- Healthier Digital Lifestyle

This is a different life on the screen from disappearing into a video game or polishing one's avatar. This is breaking open a medium with human generosity and empathy.

- An Opening For Stronger Family Care

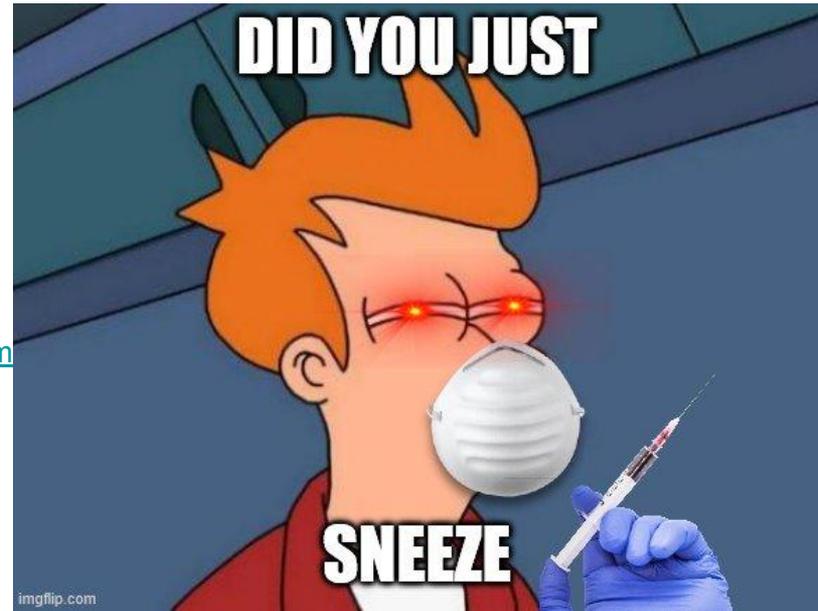

The coronavirus pandemic has revealed gaping holes in our care infrastructure, as millions of American families have been forced to navigate this crisis without a safety net. With loved ones sick and children suddenly home from school indefinitely, they've been forced to make impossible choices among their families, their health and financial ruin.

Preventing the Spread Of COVID-19

- Avoid contact with people that are sick
- Clean and Disinfect frequently touched objects and surfaces
- Avoid touching yours eyes nose and mouth
- Cover your cough or sneeze with a tissue
- Stay when home when your sick
- Wash your hands often with soap and hot

Water for at least 20 seconds

Myths About The CoronaVirus

- Children cannot catch covid-19

All age groups can become infected. Most cases, so far, have been in adults, but children are not immune. In fact, preliminary evidence shows that children are just as likely to become infected, but their symptoms tend to be less severe.

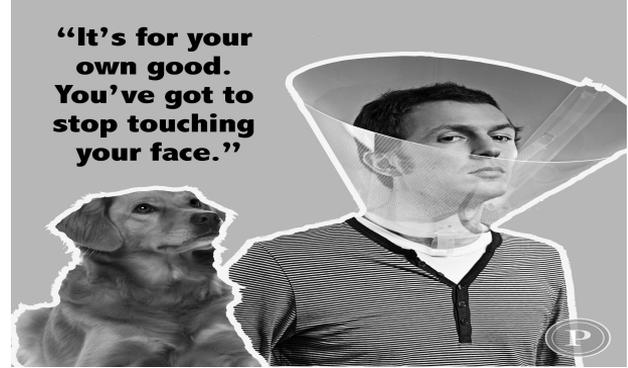

- Covid-19 is like the flu

SARS-CoV-2 causes illness that does, indeed, have flu-like symptoms, such as aches, fever, and cough. Similarly, both COVID-19 and flu can be mild, severe, or, in rare cases, fatal. Both can also lead to pneumonia.

- Hand Dryers kill coronavirus

Hand dryers do not kill coronavirus. The best way to protect yourself and others from the virus is to wash your hands with soap and water or an alcohol-based hand rub.

How It Is In 2020 With CoronaVirus

I believe Covid-19 has affected my life a lot. Me being in my house 24/7 and barely going out due to the virus really sucks. Right now nobody I know in my family has it so hopefully it stays like that. I've had a lot of loneliness and self reflection and a lot of depression but I'm doing better now. I hope I don't get the virus and if I do I want to be a survivor not a victim. I'll stay strong and live to the future.

Prediction How Future Pandemics Will Be

I think we will be more technology base and be more prepared as well as do more research into viruses.

Thank You For Watching!
